Mobile Device Programming
(Laurea Magistrale in Informatica, a.a. 2018-2019)

Outline

- 1 Power Services
- 2 Vibrator Services
- 3 Alarm Services
- 4 Sensor Services
- 5 Connectivity Services
- 6 Wi-Fi Services
- 7 Conclusion

Outline

- 1 Power Services
- 2 Vibrator Services
- 3 Alarm Services
- 4 Sensor Services
- 5 Connectivity Services
- 6 Wi-Fi Services
- 7 Conclusion

- The battery of our phones must be used wisely

Example

```
1 val pm = getSystemService(Context.POWER_SERVICE) as PowerManager
2 val wl = pm.newWakeLock(PowerManager.PARTIAL_WAKE_LOCK, "MyApp:MyTag")
3 wl.acquire()
4 // ...screen will stay on during this section...
5 wl.release()
```

- Proper permissions in application's manifest
- Methods: `isScreenOn`, `isPowerSaveMode`, ...
- Device battery life will be significantly affected by the use of this API
 - ▶ Do not acquire locks unless you really need them
 - ▶ Be sure to release them as soon as possible.

Flag Value	CPU	Screen	Keyboard
<code>PARTIAL_WAKE_LOCK</code>	On*	Off	Off

Outline

- 1 Power Services
- 2 Vibrator Services**
- 3 Alarm Services
- 4 Sensor Services
- 5 Connectivity Services
- 6 Wi-Fi Services
- 7 Conclusion

Example

```
1 val vibrator = getSystemService(Context.VIBRATOR_SERVICE) as Vibrator
```

- Some methods:
 - ▶ `hasVibrator()`
 - ▶ `cancel();`
 - ▶ `vibrator.vibrate(VibrationEffect.createOneShot(milliseconds,amplitude))`
- Needs `android.permission.VIBRATE`

Outline

- 1 Power Services
- 2 Vibrator Services
- 3 Alarm Services**
- 4 Sensor Services
- 5 Connectivity Services
- 6 Wi-Fi Services
- 7 Conclusion

- Allows one to schedule an application to be run in the future
 - ▶ When an alarm goes off, the Intent that had been registered for it is broadcast by the system and the target application is run automatically
 - ▶ Registered alarms are retained while the device is asleep (and can optionally wake it up)
 - ★ They are cleared if it is turned off and rebooted
- Beginning with API 19, the OS shifts alarms to minimize wakeups and battery use
 - ▶ There are new APIs to support applications that need strict delivery guarantees

Example

```
1 val alarmManager = getSystemService(Context.ALARM_SERVICE) as AlarmManager
```

- `set(Exact)(type: Int, triggerAtMillis: Long, operation: PendingIntent!)`
 - ▶ Schedule an alarm
- `set(Inexact)Repeating(type: Int, triggerAtMillis: Long, intervalMillis: Long, operation: PendingIntent!)`
 - ▶ Schedule a repeating alarm
- `cancel(operation: PendingIntent!)`
 - ▶ Remove all alarms that match
- `setWindow(type: Int, windowStartMillis: Long, windowLengthMillis: Long, operation: PendingIntent!)`
 - ▶ Schedule an alarm to be delivered within a given window of time

Outline

- 1 Power Services
- 2 Vibrator Services
- 3 Alarm Services
- 4 Sensor Services**
- 5 Connectivity Services
- 6 Wi-Fi Services
- 7 Conclusion

- Android supports three broad categories of sensors
 - ▶ Motion sensors: accelerometers, gravity sensors, gyroscopes, and rotational vector sensors
 - ▶ Environmental sensors: barometers, photometers, and thermometers
 - ▶ Position sensors: orientation sensors and magnetometers
- Sensor framework helps
 - ▶ Determine which sensors are available on a device
 - ▶ Determine an individual sensor's capabilities
 - ▶ Acquire raw sensor data
 - ▶ Register and unregister sensor event listeners that monitor sensor changes
- Key elements
 - ▶ `SensorManager`, `Sensor`, `SensorEvent`, and `SensorEventListener`

Sensors [\[http://developer.android.com/guide/topics/sensors/sensors_overview.html\]](http://developer.android.com/guide/topics/sensors/sensors_overview.html)

Sensor	Type	Description	Common Uses
TYPE_ACCELEROMETER	Hardware	Measures the acceleration force in m/s^2 that is applied to a device on all three physical axes (x, y, and z), including the force of gravity.	Motion detection (shake, tilt, etc.).
TYPE_AMBIENT_TEMPERATURE	Hardware	Measures the ambient room temperature in degrees Celsius ($^{\circ}C$). See note below.	Monitoring air temperatures.
TYPE_GRAVITY	Software or Hardware	Measures the force of gravity in m/s^2 that is applied to a device on all three physical axes (x, y, z).	Motion detection (shake, tilt, etc.).
TYPE_GYROSCOPE	Hardware	Measures a device's rate of rotation in rad/s around each of the three physical axes (x, y, and z).	Rotation detection (spin, turn, etc.).
TYPE_LIGHT	Hardware	Measures the ambient light level (illumination) in lx.	Controlling screen brightness.
TYPE_LINEAR_ACCELERATION	Software or Hardware	Measures the acceleration force in m/s^2 that is applied to a device on all three physical axes (x, y, and z), excluding the force of gravity.	Monitoring acceleration along a single axis.
TYPE_MAGNETIC_FIELD	Hardware	Measures the ambient geomagnetic field for all three physical axes (x, y, z) in μT .	Creating a compass.
TYPE_ORIENTATION	Software	Measures degrees of rotation that a device makes around all three physical axes (x, y, z). As of API level 3 you can obtain the inclination matrix and rotation matrix for a device by using the gravity sensor and the geomagnetic field sensor in conjunction with the <code>getRotationMatrix()</code> method.	Determining device position.

Example

```
1 val deviceSensors: List<Sensor> = mSensorManager.getSensorList(Sensor.TYPE_ALL)
```

- getDefaultSensor() returns default sensor of a given type
 - ▶ If a default sensor does not exist, the method call returns null, which means the device does not have that type of sensor

Example

```
1 if (mSensorManager.getDefaultSensor(Sensor.TYPE_GRAVITY) != null) {  
2     val gravSensors: List<Sensor> = mSensorManager.getSensorList(Sensor.TYPE_GRAVITY)  
3     // Use the version 3 gravity sensor.  
4     mSensor = gravSensors.firstOrNull { it.vendor.contains("Google LLC") && it.version == 3 }  
5 }
```

How to monitor sensor events

Implement two callback methods that are exposed through the `SensorEventListener` interface:

- `onAccuracyChanged()`
 - ▶ Accuracy is represented by one of four status constants
 - ★ `SENSOR_STATUS_ACCURACY_LOW`, `SENSOR_STATUS_ACCURACY_MEDIUM`, `SENSOR_STATUS_ACCURACY_HIGH` or `SENSOR_STATUS_UNRELIABLE`
- `onSensorChanged()`
 - ▶ A `SensorEvent` object contains information about the new sensor data
 - ★ Accuracy of the data, the sensor that generated the data, the timestamp at which the data was generated, and the new data that the sensor recorded

Outline

- 1 Power Services
- 2 Vibrator Services
- 3 Alarm Services
- 4 Sensor Services
- 5 Connectivity Services**
- 6 Wi-Fi Services
- 7 Conclusion

- Checks the state of network connectivity

Example

```
1 val connectivityManager = getSystemService(Context.CONNECTIVITY_SERVICE) as ConnectivityManager
```

- Monitors Wi-Fi, GPRS, UMTS, ecc.
- Sends broadcast intents when network connectivity changes
- Attempts to "fail over" to another network when connectivity to a network is lost
- Provides an API that allows applications to query the state of the available networks
- Needs proper permissions

Outline

- 1 Power Services
- 2 Vibrator Services
- 3 Alarm Services
- 4 Sensor Services
- 5 Connectivity Services
- 6 Wi-Fi Services**
- 7 Conclusion

Manages all aspects of Wi-Fi connectivity

- `getWifiState()`
 - ▶ Returns `WIFI_STATE_DISABLED`, `WIFI_STATE_DISABLING`, `WIFI_STATE_ENABLED`, `WIFI_STATE_ENABLING`, `WIFI_STATE_UNKNOWN`
- `isWifiEnabled()` / `setWifiEnabled()`
- `getConfiguredNetworks()`
- `addNetwork(WifiConfiguration config)`
- `updateNetwork(WifiConfiguration config)`
- `removeNetwork(int netid)`
- `startScan()`
- `getScanResults()`

Outline

- 1 Power Services
- 2 Vibrator Services
- 3 Alarm Services
- 4 Sensor Services
- 5 Connectivity Services
- 6 Wi-Fi Services
- 7 Conclusion**

Many other services...

[<http://developer.android.com/reference/android/content/Context.html>]

For example:

- Audio Service
- Bluetooth Service
- KeyGuard Services
- NFC Service
- Telephony Services
- and other ...

Summary

Android Applications are structured as a single Activity or a group of Activities

- Intents to call other activities
- Layout and Views to setup the GUI
- Events to manage the interactions with the user

Activities execute only in foreground

- Updates in background mode
 - ▶ A Service provides a robust environment for background tasks
- Notifications in case of changes
