

## Feature...

- ...a property of interest that can help us index an object
- For a “student record”
  - student\_ID can be a feature
- What are the features for an image?

María Luisa Sapino (BDM 2018)

---

---

---

---

---

---

---

---

## Image features

- There are many possible features
  - Color histogram
  - Texture
  - Edges
  - Shapes
  - Objects
  - Object or scene semantics
- Feature selection: which one to use for indexing?

María Luisa Sapino (BDM 2018)

---

---

---

---

---

---

---

---

## Good feature..

- A good feature is **significant** and enables us to **differentiate** objects from others as much as possible
- A good feature corresponds to users' perception as much as possible
  - Relevance feedback!!!!

María Luisa Sapino (BDM 2018)

---

---

---

---

---

---

---

---

## What does “significant” mean

- Information theoretic sense:
  - An event is more significant if it carries more information

Maria Luisa Sapino (BDM 2018)

---

---

---

---

---

---

---

---

## What does “significant” mean

- Information theoretic sense:
  - An event is more significant if it carries more information
  - An event that has high occurrence rate carries less information
    - Solar eclipse is more interesting than sunset

High frequency ----- less information  
Low frequency ----- high information

Maria Luisa Sapino (BDM 2018)

---

---

---

---

---

---

---

---

## Entropy

- Total information content (uncertainty)

$$H(X) \equiv \sum_{x \in \mathcal{A}_X} P(x) \log \frac{1}{P(x)}$$

Maria Luisa Sapino (BDM 2018)

---

---

---

---

---

---

---

---

## Entropy (example)

- Total information content (uncertainty)

$$H(X) \equiv \sum_{x \in \mathcal{A}_X} P(x) \log \frac{1}{P(x)}$$

$P(a) = 0.5, P(b) = 0.5 \rightarrow H > 0$  more uncertain

$P(a) = 1.0, P(b) = 0.0 \rightarrow H = 0$  less uncertain

Maria Luisa Sapino (BDM 2018)

---

---

---

---

---

---

---

---

## Entropy (example)

- Total information content (uncertainty)

$$H(X) \equiv \sum_{x \in \mathcal{A}_X} P(x) \log \frac{1}{P(x)}$$

$P(a) = 0.5, P(b) = 0.5 \rightarrow H > 0$  more uncertain  
more information

$P(a) = 1.0, P(b) = 0.0 \rightarrow H = 0$  less uncertain  
less information

Maria Luisa Sapino (BDM 2018)

### Linearly Independent Eigenvectors

- Suppose that  $A$  is an  $n \times n$  square matrix. If the eigenvalues,  $c_1, \dots, c_k$  are distinct, then eigenvectors  $v_1, \dots, v_k$  are a set of  $k$  linearly independent vectors.

Maria Luisa Sapino (BDM 2018)

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

$$A[i, j] = \text{Cov}(i, j) = E((F_i - \mu_i)(F_j - \mu_j))$$

## Eigen decomposition

Maria Luisa Sapino (BDM 2018)

---

---

---

---

---

---

---

---

## ...reminder

- Eigenvalue and eigenvector
- Given a matrix A, let c (scalar) and x (vector) be such that

$$c \vec{x} = A \vec{x}$$

Eigenvalue      Eigenvector

Maria Luisa Sapino (BDM 2018)

---

---

---

---

---

---

---

---

## Properties of Eigenvectors

- Suppose that A is an  $n \times n$  square matrix
  - if the eigenvalues,  $c_1, \dots, c_k$ , are distinct, then eigenvectors  $v_1, \dots, v_k$  are a set of k **linearly independent** vectors.
    - thus they can be used as the basis of the space!!!
  - The value of  $c_i$  describes the contribution of  $v_i$  in A. Thus
    - if we pick an A that describe the **variation of data**,
    - $c_i$  will describe **the directions along which variation is high**

Maria Luisa Sapino (BDM 2018)

---

---

---

---

---

---

---

---

## eigen decomposition

---

---

---

---

---

---

---

---

## eigen decomposition

---

---

---

---

---

---

---

---

## How many eigenvectors shall we maintain?

- **Mean eigenvalue:** use only the dimensions whose eigenvalues are greater than or equal to the mean eigenvalue.
  - **Kaiser rule:** keep only those eigenvectors whose eigenvalues are greater than 1.
  - **Parallel analysis:**
    - analyze a random covariance matrix,
    - Plots cumulative eigenvalues for both random and intended matrices;
    - Find where the two curves intersect.
  - **Scree test:** plot the successive eigenvalues to find a point where the plot levels off.
  - **Variance explained:** keep enough dimensions to account for 95% of the initial variance
- Maria Luisa Sapino (BDM 2018)

---

---

---

---

---

---

---

## Compactness of a database

$$\text{comp}(D) = \sum_{i \neq j} \text{similarity}(o_i, o_j)$$

Maria Luisa Sapino (BDM 2018)

---

---

---

---

---

---

---

---

## Compactness of a database

$$\text{comp}(D) = \sum_{i \neq j} \text{similarity}(o_i, o_j)$$

Maria Luisa Sapino (BDM 2018)

---

---

---

---

---

---

---

---

## Compactness of a database

$$\text{comp}(D) = \sum_{i \neq j} \text{similarity}(o_i, o_j)$$

A compact database is not desirable!!!

Maria Luisa Sapino (BDM 2018)

---

---

---

---

---

---

---

---

## Feature quality

- A feature is
- good if we remove it, the overall compactness increases
  - bad if we remove it, the overall compactness decreases

---

---

---

---

---

---

---

---

## Problem...

- Feature vector size:  $628 \times 1024$ 
  - Dimensionality curse: high dimensions make indices unusable (10-15 dimensions max!!!)

---

---

---

---

---

---

---

---

## Problem...

- Feature vector size:  $628 \times 1024$ 
  - Dimensionality curse: high dimensions make indices unusable (10-15 dimensions max!!!)
- Solution: Reduce # dimensions of the vector
  - use distance-preserving transforms
  - Ex: fourier trans., DCT, wavelet trans.

---

---

---

---

---

---

---

---

## Transforms

Maria Luisa Sapino (BDM 2018)

---

---

---

---

---

---

---

---

## Transforms

Maria Luisa Sapino (BDM 2018)

---

---

---

---

---

---

---

---

## Transforms

Distances and angles are preserved

Maria Luisa Sapino (BDM 2018)

---

---

---

---

---

---

---

---

## Transforms

Distances and angles are preserved

Some dimensions are more important (differentiating) than the other

Maria Luisa Sapino (BDM 2018)

---

---

---

---

---

---

---

---

## Transforms

Distances and angles are preserved

Some dimensions are more important (differentiating) than the other

Eliminate unimportant dimensions

Maria Luisa Sapino (BDM 2018)

---

---

---

---

---

---

---

---

## Transform + Projection (Compression or Feature selection)

Maria Luisa Sapino (BDM 2018)

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

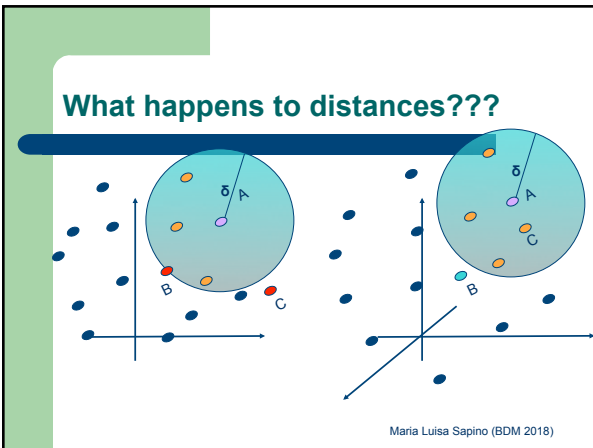

---

---

---

---

---

---

---

---

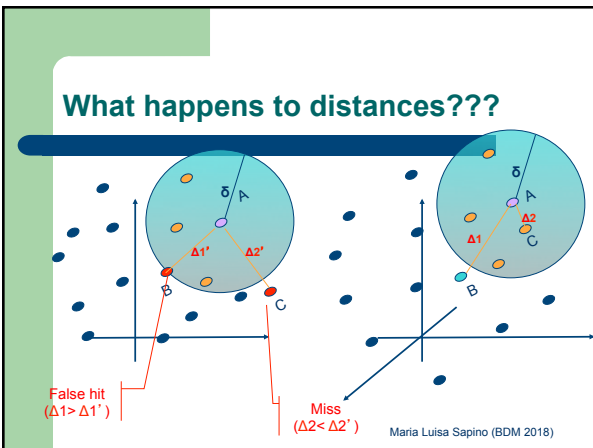

---

---

---

---

---

Misses are not desirable!  
Can not be eliminated with postprocessing

### What happens to distances???

---

---

---

---

---

---

---

---
